Helping Patients and their Families After an Attempt: A Guide for Medical Providers

The emergency department (ED) is the frontline of medicine and often serves as the doorway into the medical system for people in distress, including people who attempt suicide. A 2016 analysis of pooled data from the National Survey of Drug Use and Health and the U.S. Mortality Files from the National Vital Statistics System found that 3.2 percent of adults who attempted suicide in the United States during a 12-month period died by suicide.¹ The ED is often the initial point of contact with the health system for many of these individuals, and it offers a unique opportunity to help people who have attempted suicide to begin to recover from the depression and hopelessness that led to their suicide attempt.

The purpose of this brochure is to provide you with some quick tips to enhance care in the ED for people who have attempted suicide, while also providing information on the Health Insurance Portability and Accountability Act (HIPAA), patient discharge, and resources about suicide for medical professionals, patients, and their families.

Patient Care in the Emergency Department: Helpful Tips

Medical and psychological assessment and the development of a suicide prevention or safety plan are key steps in treating an individual who has attempted suicide. Your medical training no doubt provided you with the tools to perform a thorough assessment of an individual who has attempted suicide, including exploring physical conditions that may contribute to a person's behavior. However, for more information on this topic, The Joint Commission's *Sentinel Event Alert 56: Detecting and treating suicide ideation in all settings* is an excellent resource. http://www.jointcommission.org/sea_issue_56

In addition to your assessment, communicating with others who may have more information about a patient's history, such as a family member or another physician, often can provide valuable insight as you assess the patient's situation. Any such communications about a patient's protected health information must be in accordance with the Federal patient privacy standards known as the HIPAA. Here are some brief highlights of HIPAA:

¹ Han, B., Kott, P., Hughes, A., McKeon, R., Blanco, C., & Compton, W. (2016). Estimating the rates of deaths by suicide among adults who attempt suicide in the United States. *Journal of Psychiatric Research*, 77, 125-133.

Communicating With a Patient's Family or Other Caregiver

- HIPAA allows the disclosure of protected health information to a family member or caregiver in the following situations:
 - ⇒ If the patient consents to his or her information being shared.
 - ⇒ If hospital personnel provide the patient with the opportunity to object to the disclosure, and the patient does not express an objection.
 - ⇒ If it is reasonable to infer from the circumstances that the patient does not object to the disclosure.
- If an emergency physician, based on his or her best medical judgment, feels the patient lacks the capacity to provide informed consent, and that disclosure is in the patient's best interest, then the emergency physician can communicate directly with a patient's family or other caregiver, even if a patient objects.
- However, information shared with family members or other caregivers should be limited to that which is directly relevant to the caregiver's involvement with the patient's care or payment for that care.

Remember: Although confidentiality laws may restrict you from communicating medical information to nonmedical attendants, HIPAA allows you to receive unlimited information from families or other caregivers without patient consent.

Communicating With Other Medical Professionals About a Patient

If possible, consult with an individual's inpatient and/or outpatient provider to help maintain continuity of care and allow for informed decisionmaking by the individual and his or her treatment team.

As long as a good faith effort has been made to inform your patient about your institution's privacy practices, HIPAA allows you to:

- Share information about the person with other medical providers who are involved in the person's care, both within and outside of your own institution. This applies to all forms of communication (e.g., verbal, electronic, written).
- Provide your name and contact information to another medical provider for communication about the person.

To read more about HIPAA, visit <https://www.hhs.gov/hipaa/index.html>.

Patient Discharge From the Emergency Department: What the ED Can Do To Ease the Transition

In addition to your assessment and interventions for a person in the ED, a well-conceived discharge plan will go a long way in helping people safely and successfully begin to recover. Here are a few things to consider when developing a person's discharge plan. Before leaving the ED, it is recommended that the patient and his or her family, if appropriate, should have:

- An understanding of discharge arrangements.
- A written statement with information about prescribed medication(s) and treatment plans.
- Key contacts to call—including outpatient providers, crisis lines, and peer-support centers.
- Specific instructions about the signs, symptoms, or conditions that require a return.

Other key points to discuss with patients *and* families before discharge include:

- What to look for that may indicate a return of suicidal feelings.
- Followup care—Who? Where? When?
- How to get resources and supports in the community.
- How to reduce the immediate hazards of another suicide attempt (such as information on removing or restricting items that are frequently used for self-harm).
- Who to call with questions or concerns.

If a patient is being discharged and an appointment for followup care cannot be arranged before discharge, strongly encourage the patient to seek followup care within the first few days of returning home. In areas where this service is available, mobile crisis teams have been effective in helping patients in crisis connect with outpatient treatment following an emergency visit. Consider linking your patient with a team in your area to increase the chances that he or she will access followup care. Also remind your patient that the emergency department is open 24 hours a day, 365 days a year to help, if he or she continues to have thoughts of suicide or if the medical team is unavailable to provide the needed care.

One of the most important things you can do for a patient or family member after having been in the ED is to offer hope. Patients and families will look to you to determine the prognosis and for some assurance that this will not happen again. While you cannot guarantee there will not be a recurrence, you *can* assure them that recovery is likely if the individual and, if appropriate, a family member work closely with a therapist to ensure that the safety and treatment plans are meaningful and effective.

The following pages of this brochure offer a list of crisis lines and referrals for more information on suicide and mental illness for patients and their families. Please also consider providing your patient with a copy of the brochure *Taking Care of Yourself After an Attempt*, and its companion brochure for families, *Taking Care of Your Family Member After an Attempt*. Each brochure includes information on safety and recovery, as well as additional resources for help.

Following these tips should increase the likelihood that your patients who have attempted suicide find the longer-term care that will prevent another attempt—one that could be fatal. You and the professional team around you can make the difference.

Resources for Professionals in the Emergency Department

Patient Assessment and Care

Caring for Adult Patients with Suicide Risk: A Consensus Guide for Emergency Departments. Provides information about decision support, brief interventions, and discharge planning with adult patients who have been identified as having some risk of suicide. It is endorsed by the American Academy of Emergency Medicine, American Association of Emergency Psychiatry, American Association of Suicidology, and American Foundation for Suicide Prevention. Full and Quick Guides available at: www.sprc.org/ed-guide

Assessment and Management of Patients at Risk for Suicide. Department of Veterans Affairs/Department of Defense Clinical Practice Guideline. <http://www.healthquality.va.gov/guidelines/MH/srb>

Sentinel Event Alert 56: Detecting and treating suicide ideation in all settings. Through this alert, The Joint Commission aims to assist all health care organizations providing both inpatient and outpatient care to better identify and treat individuals with suicide ideation. http://www.jointcommission.org/sea_issue_56

Suicide Assessment Five-Step Evaluation and Triage (SAFE-T): Pocket Card for Clinicians. Assists clinicians to conduct a suicide assessment using a 5-step evaluation and triage plan to identify risk and protective factors; conduct a suicide inquiry; determine risk level and potential interventions; and document a treatment plan. Free from SAMHSA Store (www.store.samhsa.gov). Also available on Suicide Safe mobile app.

Suicide Safe. Mobile app. Helps providers integrate suicide prevention strategies into their practice and address suicide risk among their patients. The app is based on SAMHSA's Suicide Assessment Five-Step Evaluation and Triage (SAFE-T) card. Free.

Zero Suicide in Health and Behavioral Healthcare. Zero Suicide is a commitment to suicide prevention in health and behavioral healthcare systems and is also a specific set of strategies and tools. <http://zerosuicide.sprc.org/>

Emergency Medicine Organizations

American College of Emergency Physicians promotes the highest quality of emergency care and is the leading advocate for emergency physicians, their patients and the public.
