Smoking remains the Nation's leading cause of preventable illness and death. Antismoking efforts have been undertaken to address this problem, and many of these efforts place particular emphasis on adolescents and young adults because most adult smokers initiate cigarette use before the age of 25. Schools offer health education programs targeting cigarette use, and antismoking campaigns educate young people about the dangers of smoking. States have increased enforcement of the Synar Amendment, which requires States to have and enforce laws prohibiting the sale and distribution of tobacco products to persons younger than 18. In addition, because higher prices can make cigarette use cost prohibitive for young people, the Federal government and many States have recently enacted substantial increases in cigarette taxes in an effort to reduce the number of young people who smoke and to reduce consumption among those who continue to smoke. Monitoring trends in cigarette use among adolescents and young adults can help further refine educational and enforcement efforts.
The National Survey on Drug Use and Health (NSDUH) can be used to examine trends in smoking behavior over time. NSDUH asks persons aged 12 or older if they smoked part or all of a cigarette in the past 30 days. Respondents who answered affirmatively were asked about the number of days they smoked during the past month and the number of cigarettes they smoked per day. This issue of The NSDUH Report examines trends since 2004, with a particular focus on recent trends from 2008 to 2010, in cigarette use among adolescents aged 12 to 17 and among young adults aged 18 to 25. These trends include use in the past month, daily use in the past month, and number of cigarettes smoked per day among daily smokers.

**Trends in Cigarette Use among Adolescents Aged 12 to 17**

During the 7-year period between 2004 and 2010, the percentage of adolescents aged 12 to 17 reporting past month cigarette use decreased from 11.9 to 8.3 percent (Figure 1). Recent trends show that past month cigarette use was similar in 2008 (9.1 percent) and 2009 (8.9 percent), but decreased between 2008 and 2010 (from 9.1 to 8.3 percent).

![Figure 1. Past Month Cigarette Use among Persons Aged 12 to 17: 2004 to 2010](http://www.samhsa.gov/data/2k12/NSDUH047/SR047CigaretteTrends20...)
Past month smokers can be divided into two groups—those who smoke daily and those who smoke less than daily. The percentage of adolescents who smoked daily in the past month decreased from 3.3 percent in 2004 to 2.0 percent in 2008, then remained relatively stable.

**Trends in Cigarette Use among Young Adults Aged 18 to 25**

Between 2004 and 2010, the percentage of young adults aged 18 to 25 reporting past month cigarette use decreased from 39.5 to 34.2 percent (Figure 2). Recent trends show overall past month cigarette use was similar in 2008 (35.7 percent) and 2009 (35.8 percent), but decreased between 2008 and 2010 (from 35.7 to 34.2 percent).

**Figure 2. Past Month Cigarette Use among Persons Aged 18 to 25: 2004 to 2010**

![Graph showing past month cigarette use among persons aged 18 to 25 from 2004 to 2010](image)

The percentage of young adults who smoked daily in the past month decreased from 20.4 percent in 2004 to 17.2 percent in 2008, then declined further to 15.8 percent in 2010.

**Trends in Number of Cigarettes Smoked among Daily Smokers**

The number of cigarettes smoked per day among adolescent daily smokers remained relatively stable over time.
(Figure 3); however, changes were seen among 18- to 25-year-olds (Figure 4). Between 2004 and 2008, the percentage of daily smokers in this age group who smoked 26 or more cigarettes per day (about one and a half packs or more) remained relatively stable at about 5 to 6 percent. However, this percentage decreased to 4.0 percent in 2009 and 3.4 percent in 2010. On the other end of the spectrum, about 25 percent of daily smokers aged 18 to 25 smoked 5 or fewer cigarettes per day between 2004 and 2008; from 2008 to 2010, this percentage increased from 24.7 to 28.6 percent.

The National Survey on Drug Use and Health (NSDUH) is an annual survey sponsored by the Substance Abuse and Mental Health Services Administration (SAMHSA). The combined 2004 to 2010 data used in this report are based on information obtained from 157,524 persons aged 12 to 17 and 158,794 persons aged 18 to 25. The survey collects data by administering questionnaires to a representative sample of the population through face-to-face interviews at their place of residence.

The NSDUH Report is prepared by the Center for Behavioral Health Statistics and Quality (CBHSQ), SAMHSA, and by RTI International in Research Triangle Park, North Carolina. (RTI International is a trade name of Research Triangle Institute.)

Information on the most recent NSDUH is available in the following publication:
